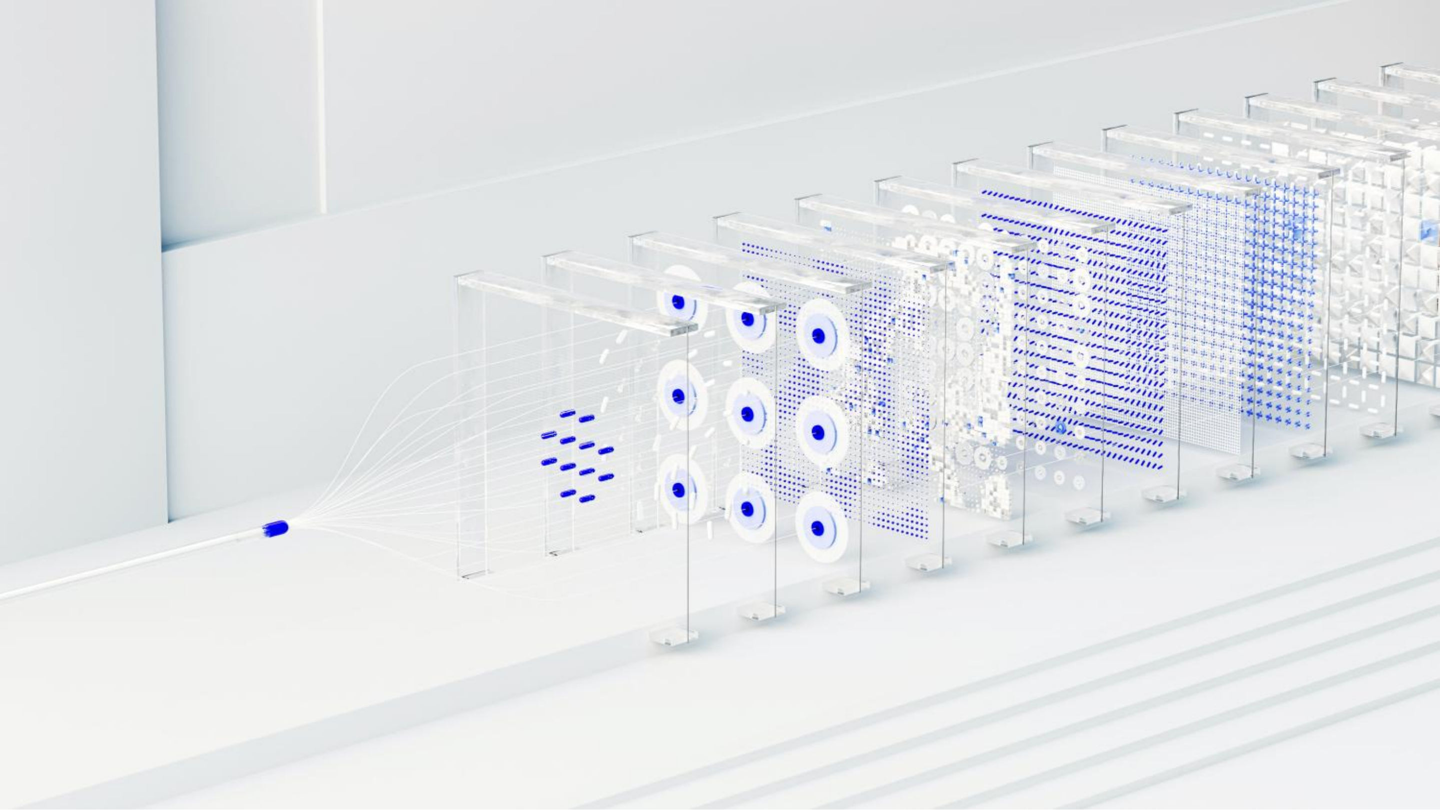
AI Impact Assessment | 25 Apr 2026

Ripple Co - 2026



Introduction

This report presents an assessment of how Artificial Intelligence (AI) is expected to impact roles within the organization, with a focus on task-level transformation, workforce implications, and role redesign opportunities.

The objective of the assessment is not to determine whether roles will be replaced, but to provide a structured view of:

- Which parts of work are most exposed to automation
- Where AI can enhance productivity and decision-making
- How roles may need to evolve in scope, structure, and skill requirements

The insights generated are intended to support decisions on workforce planning, job redesign, and capability development decisions.

Approach

Based on the **48 roles** that were analysed, the assessment follows a structured, task-based methodology comprising **three steps.**

1

Task Decomposition & AI Impact Quantification

Each role is decomposed into its core activities, which are then evaluated based on whether they can be automated or augmented. The distribution of tasks across these two categories is then quantified into two key metrics:

Automation Impact Score (AIS)

Measures a role's structural readiness to execute end-to-end tasks via AI without human intervention.

Augmentation Potential Score (APS)

Measures the degree to which AI adoption will enhance and amplify the outcomes of a role without displacing the human incumbent.

2

Role Classification

The AIS and APS scores are used in combination to plot each role against the **AI Risk Impact Assessment (ARIA)** framework. This classification is done against a 3 x 3 matrix to provide a clear view of how each role is expected to evolve - whether it is likely to experience volume reduction, require structural redesign, benefit from targeted investment, or be enhanced through AI-enabled workflows.

3

Capability Mapping

Based on how tasks are expected to change, the assessment identifies the skills required in the future state. This ensures that the analysis does not stop at impact, but translates directly into what skills must be developed, shifted, or strengthened to enable successful role transformation.

How to Read this Report

The report should be read as a progression from **impact identification** to **action prioritisation**.

The Automation Impact Score (AIS) and Augmentation Potential Score (APS) are categorised into three ranges:

- Low (0-39): Limited exposure to automation or augmentation; work remains largely human-driven
- Medium (40-69): Partial exposure; meaningful opportunities for workflow redesign and efficiency gains
- High (71-100): Significant exposure; structural changes to the role are likely

The classification against the ARIA framework provides a simplified view of these dynamics, indicating whether a role should be automated, redesigned, invested in, or augmented (refer to the diagram below for a representation of the ARIA framework).

	Low AIS (0 – 39)	Med AIS (40 – 69)	High AIS (70 – 100)
High APS (70 – 100)	**Expand** Low risk, big AI multiplier *Embed AI to expand role scope, opportunity to scale up human interaction*	**Optimize** Good risk reward *Scale AI-human teams or shift to high-judgement task before automation erodes routine components.*	**Transform** Highest AI Impact *Radical redesign, role to become AI orchestration.*
Med APS (40 – 69)	**Invest Selectively** Low risk, moderate upside *Spot pockets for efficiency.*	**Adapt** Balanced risk or opportunity *Integrate AI into workflows, train on AI collaboration.*	**Accelerate** High Risk *Begin role restructuring. Deploy AI aggressively to mitigate risk, redesign around AI strengths.*
Low APS (0 - 39)	**Maintain** Minimal AI threat or upside. Human intervention required *Retain status quo.*	**Monitor** AI upside for routine tasks with minimal gains *Apply AI for selective tasks without role overhaul.*	**Transition** Replaceable with AI *Transition to adjacent roles via training.*

Low Priority Medium Priority High Priority

The task-level analysis then explains why the role falls into that category, while the capability mapping highlights what needs to change to support the transition.

Executive Summary & Findings

Executive Summary

Ripple Co | Outsourced Finance & Accounting Services Provider

Workforce Snapshot

Key workforce AI impact indicators across the organisation

Roles Assessed	Total Full-time Equivalents (FTEs)	Roles with High Automation Impact	Roles with High Augmentation Potential
48 7 Departments	**240**	**5** 37 FTEs	**23** 75 FTEs

	Low AIS (0 – 39)	Med AIS (40 – 69)	High AIS (70 – 100)
High APS (70 – 100)	Expand **18** 51 FTE	Optimize **5** 24 FTE	Transform **0** 0 FTE
Med APS (40 – 69)	Invest Selectively **0** 0 FTE	Adapt **20** 128 FTE	Accelerate **0** 0 FTE
Low APS (0 - 39)	Maintain **0** 0 FTE	Monitor **0** 0 FTE	Transition **5** 37 FTE

Low Priority Medium Priority High Priority

Bottom Line

The majority of this workforce is not under threat from AI — it stands to benefit from it. 53% of all FTEs sit in Adapt roles, predominantly across Finance & Accounting and Client Delivery, where AI will change how work gets done without eliminating the need for the people doing it. A further 21% sit in Expand roles across FP&A, Operations, Finance, and Client Solutions, where augmentation potential is highest and AI investment will directly amplify what analytical and advisory staff can achieve. Together these two cohorts represent 179 FTEs whose value grows with deliberate AI capability investment.

Executive Summary

Ripple Co | Outsourced Finance & Accounting Services Provider

The 5 roles with High Automation Impact tell a sharper story. The Accounts Payable Clerk, Invoice Processing Officer, Payroll Administrator, Junior GL Accountant, and HR Administrator carry AIS scores between 72 and 81. Majority of their daily task volume is automatable at high confidence today. These 37 FTEs are not at risk in the abstract, but rather, they are at risk now. Without a structured redeployment plan in place within the next 12 months, this headcount will reduce through attrition rather than by design. Organisations could lose the window to retain institutional knowledge and place people into roles where they add more value.

The 23 roles with High Augmentation Potential that spans across roles such as FP&A Manager, Tax Manager, Senior Financial Analysts, Client Relationship Managers, Solutions Consultants, and specialist roles across tax, compliance, operations, and delivery management represent the organisation's highest-return workforce investment. These 75 FTEs will not be replaced by AI. They will be made significantly more capable by it. The organisation that equips them first gains a compounding productivity advantage that is hard to close once established.

The two priorities are not in competition. Containing the displacement risk in 5 transactional roles and capturing the augmentation upside in 23 advisory and analytical roles are parallel workstreams. Both require action now without dependency on the other.

Executive Summary

Ripple Co | Outsourced Finance & Accounting Services Provider

Implications on Workforce Redesign

Understanding what each cell demands and where the real risks lie

	Low AIS (0 – 39)	Med AIS (40 – 69)	High AIS (70 – 100)
High APS (70 – 100)	Expand 18 51 FTE	Optimize 5 24 FTE	Transform 0 0 FTE
Med APS (40 – 69)	Invest Selectively 0 0 FTE	Adapt 20 128 FTE	Accelerate 0 0 FTE
Low APS (0 - 39)	Maintain 0 0 FTE	Monitor 0 0 FTE	Transition 5 37 FTE

Low Priority Medium Priority High Priority

Based on the distribution of roles highlighted on the ARIA matrix above, the following table highlights the potential opportunities, operational and transformation implications for the next 12 months. It outlines priority actions leadership can take to strengthen readiness, capture value from AI-driven transformation, and proactively address areas of vulnerability before they become operational challenges.

ARIA Cell	Potential	Blind Spots	Next Steps
Expand	Highest-return investment in the organisation. AI amplifies the quality of analysis, advice, and client communication for 51 FTEs with no displacement risk.	Urgency of Transition crowds out this investment. Tools land without capability to use them. KPIs stay anchored to old role definitions while scope evolves.	• Deploy AI tools for financial modelling, advisory synthesis, and tax research by Q3 • Launch AI capability programme for all 51 FTEs • Update KPIs to reflect expanded output expectations

Executive Summary

Ripple Co | Outsourced Finance & Accounting Services Provider

Optimize	Fastest measurable win. Automating the structured task layer in these 5 roles frees capacity for analytical and judgment work that AI can further elevate. Measurable output improvement within months.	Automation narrows scope without expanding it, roles disengage. Without augmentation following automation, these roles drift toward Adapt rather than growing toward Expand.	• Sequence automation by confidence level per role. • Introduce AI tools for reconciliation, compliance analysis, and reporting. • Expand advisory scope to absorb freed capacity.
Transition	A bounded, solvable problem. 37 FTEs carrying institutional knowledge are strong redeployment candidates into Adapt or Optimize — managed well, this is a capability redistribution not a headcount cut.	Attrition management loses experienced staff while keeping roles alive. Treating this as cost reduction misses the redeployment asset in 37 experienced people.	• Assess all 37 FTEs for redeployment readiness within 60 days. • Commission role redesign for all 5 roles now, define what each becomes and not what it stops doing. • Begin automation of statutory calculations, invoice processing, and payroll runs.
Adapt	Core of the AI transformation. 128 FTEs across 20 roles with genuine augmentation potential. Upskilling has a real return if paired with job architecture redesign.	Upskilling alone is not enough if job architectures do not change alongside it, people develop new capabilities but apply them in the same old role structures. The window to act is 12 to 24 months.	• Segment by AIS proximity and design targeted interventions. • Rewrite job architectures for all 20 roles. • Build Critical Output Review and AI-Assisted Decision Making as baseline skills across all 128 FTEs.

Executive Summary

Ripple Co | Outsourced Finance & Accounting Services Provider

Organization-Wide Skill Priorities

The most frequently required emerging skills across all roles

Type	Skill	Required in Roles	Frequency (%)
AI	AI-Assisted Decision Making	41 of 48	85
AI	AI Output Interpretation & Communication	32 of 48	67
AI	Critical Output Review	30 of 48	60
AI	Exception Management	19 of 48	40
Role	Client Service Management	14 of 48	29

AI Skills   Role-specific Skills

AI-Assisted Decision Making is the single most universally required skill in this assessment, needed across 85% of roles. This is not a leadership capability — it is the working skill of analysts, specialists, and coordinators whose daily output increasingly depends on evaluating what AI produces and deciding what to do with it. The dominance of this skill reflects the organisation's ARIA profile: most roles sit in Expand or Adapt, where human judgment remains central but AI is increasingly shaping the inputs to that judgment.

AI Output Interpretation and Communication follows at 67%, confirming that the ability to translate AI-generated outputs into clear, defensible conclusions for clients and colleagues is a near-universal requirement. This is particularly relevant for the 18 Expand roles, where the final deliverable is almost always a communication artifact — a recommendation, a report, a client presentation.

Critical Output Review appears in 62% of roles — the skill of catching what AI gets wrong before it reaches a client or a decision-maker. Its prevalence across functions as different as payroll processing, compliance, and financial analysis confirms it is a baseline expectation, not a specialist one.

Executive Summary

Ripple Co | Outsourced Finance & Accounting Services Provider

Exception Management is required in 40% of roles, concentrated in those with AIS above 50 where automation handles the routine flow but the human must step in when the system cannot resolve an edge case.

Client Service Management is the only role-specific skill in the top five, required across 29% of roles — all within Client Delivery and Client Solutions. Its presence confirms that client-facing communication is the next capability frontier after AI literacy: once people can work alongside AI, the differentiator becomes how well they communicate the outputs to clients.

The practical implication is direct. A single organisation-wide capability programme anchored around these four AI skills would address the core gap for the majority of the workforce regardless of function. For the 5 Transition roles, capability building must be paired with role redesign — upskilling alone is not enough when the role itself is being automated. For the 18 Expand roles, deploying AI tools alongside capability investment will generate the greatest return. Client Service Management should be treated as a follow-on priority once the AI literacy foundation is in place.

Executive Summary

Ripple Co | Outsourced Finance & Accounting Services Provider

Top 5 Roles with Highest Exposure

Roles with the highest AIS and APS scores, for immediate prioritisation

Highest AIS Roles	AIS	Highest APS Roles	APS
Payroll Administrator	81	FP&A Manager	84
Accounts Payable Clerk	80	Tax Manager	82
Invoice Processing Officer	80	Senior Financial Analyst	81
Junior GL Accountant	75	Client Relationship Manager	81
HR Administrator	72	Solutions Consultant	81

Automation Impact Score (AIS)   Augmentation Potential Score (APS)

The five roles under the most immediate automation pressure share a single profile: high-volume, rules-based processing with structured inputs and predictable outputs. The Payroll Administrator (81), Accounts Payable Clerk (80), Invoice Processing Officer (80), Junior GL Accountant (75), and HR Administrator (72) are all roles where a well-configured system outperforms a human across the majority of their daily task volume. All five sit in Transition. Together they represent 37 FTEs and should be the first priority for redeployment planning. The automation technology is available now. The decision is not technical, rather organisational.

The five roles with the strongest augmentation potential are all in Expand. The FP&A Manager (84), Tax Manager (82), Senior Financial Analyst (81), Client Relationship Manager (81), and Solutions Consultant (81) have low automation exposure and very high augmentation potential. AI does not threaten these roles. It extends what they can do. A Senior Financial Analyst equipped with AI-assisted modelling and synthesis can cover more ground and produce sharper insight in less time. A Client Relationship Manager who can rapidly synthesise account data and draft client-ready analysis becomes a stronger commercial asset. The return on AI capability investment in these 15 FTEs is disproportionately high relative to their headcount.

The contrast between the two lists is the strategic picture in miniature. The high-AIS roles are processing functions with large FTE counts where automation investment produces workforce reduction. The high-APS roles are specialist and advisory functions with smaller FTE counts where AI investment produces output improvement. Both require action. They require different interventions, different owners, and different timelines. Neither should wait for the other.

Recommendations & Next Steps

Recommendations & Next Steps

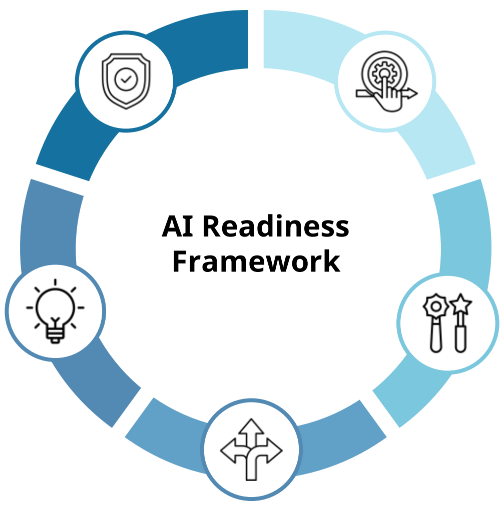
Sequenced actions aligned to the organization’s AI readiness journey

1 **Assess employee-level readiness**

Conduct an organisation-wide employee readiness assessment to evaluate the extent to which the workforce possesses the behavioural traits and adaptive capabilities required to transition into evolving role requirements. The AI Readiness dimensions applied within this assessment are shaped by leading research and recognised perspectives on AI literacy, workforce transformation, and the future of work, providing a structured basis for evaluating organisational readiness [1]. Employees’ readiness is measured across the following dimension below, and the insights generated will directly inform Step 3 by enabling targeted reskilling prioritisation, workforce redeployment planning, and capability investment decisions.

Task Safeguarding
Using AI responsibly and managing risks associated with AI usage

Task Execution
Using AI tools to complete role-relevant tasks effectively



Task Innovation
Identifying new or improved ways to apply AI within the role.

Task Enhancement
Improving efficiency and quality of work by integrating AI into workflows

Task Decisioning
Evaluating, interpreting, and making judgments on AI-generated outputs

[1] Framework informed by research from World Economic Forum (2025); Gulley & Hilliard (2025); Organisation for Economic Co-operation and Development (2024); Bankins et al. (2024); National Institute of Standards and Technology (2023); and the Advisory Council on the Ethical Use of AI and Data (2020).

Recommendations & Next Steps

Sequenced actions aligned to the organization's AI readiness journey

2

Redesign Flagged Roles

Commission a structured role redesign exercise for all 5 Transition roles: Accounts Payable Clerk, Invoice Processing Officer, Payroll Administrator, Junior GL Accountant, and HR Administrator. For each, determine whether the role can be rescoped to shift task composition toward higher-APS activities, or whether the 37 FTEs should be planned for managed redeployment into Adapt or Optimize roles.

This is a design decision, not a training decision. Assess all 37 FTEs for redeployment readiness within 60 days. Begin automation of statutory calculations, invoice processing, and payroll runs — these are the highest-confidence starting points.

3

Invest in Targeted Upskilling

Build the programme around the four universal AI skills in order of breadth. Start with Critical Output Review and AI-Assisted Decision Making (required across 85% and 62% of roles respectively), and the skills that most directly change how daily work gets done. A workforce that can evaluate what AI produces, know when to trust it, and know when to challenge it is fundamentally more resilient regardless of function.

Add AI Output Interpretation and Communication for roles that present findings and analysis to clients, and Exception Management for roles where automation handles the routine flow and the human must step in when the system cannot resolve an edge case. The return is measurable.

Upskilling is best paired with role redesign. Run this step after Step 1 and 2 to ensure job architectures have been updated and when you have a clearer understanding of the employees in the role the best way they can be upskilled.

Recommendations & Next Steps

Sequenced actions aligned to the organization's AI readiness journey

4 **Reassess and Recalibrate**

Re-run the ARIA assessment at 12 months to measure movement across the matrix. Roles should be shifting directionally: Transition roles should be reducing in headcount through redeployment, Adapt roles should be moving toward Optimize as AI capability builds, and Optimize roles should be extending toward Expand as augmentation tooling matures. Roles that have not moved indicate either insufficient upskilling investment or structural task composition issues that redesign has not resolved.

Establish the reassessment as a standing annual process. The ARIA classification is a snapshot, not a permanent state, and the distribution will shift as AI capability evolves across the industry.
